# **Super Maximum Cost Queries**

Victoria has a tree, T, consisting of N nodes numbered from 1 to N. Each edge from node  $U_i$  to  $V_i$  in tree T has an integer weight,  $W_i$ .

Let's define the cost, C, of a path from some node X to some other node Y as the maximum weight (W) for any edge in the unique path from node X to node Y.

Victoria wants your help processing Q queries on tree T, where each query contains  $\mathbf 2$  integers, L and R, such that  $L \leq R$ . For each query, she wants to print the number of different paths in T that have a cost, C, in the inclusive range [L,R].

It should be noted that path from some node X to some other node Y is considered same as path from node Y to X i.e  $\{X,Y\}$  is same as  $\{Y,X\}$ .

## **Input Format**

The first line contains  ${f 2}$  space-separated integers,  ${f N}$  (the number of nodes) and  ${f Q}$  (the number of queries), respectively.

Each of the N-1 subsequent lines contain  ${\bf 3}$  space-separated integers,  $U,\,V$ , and W, respectively, describing a bidirectional road between nodes U and V which has weight W.

The  $oldsymbol{Q}$  subsequent lines each contain  $oldsymbol{2}$  space-separated integers denoting  $oldsymbol{L}$  and  $oldsymbol{R}$ .

#### **Constraints**

- $1 \le N, Q \le 10^5$
- $1 \leq U, V \leq N$
- $1 \le W \le 10^9$
- $1 < L < R < 10^9$

## **Scoring**

- $1 \leq N, Q \leq 10^3$  for 30% of the test data.
- $1 \leq N, Q \leq 10^5$  for 100% of the test data.

#### **Output Format**

For each of the Q queries, print the number of paths in T having cost C in the inclusive range [L,R] on a new line.

#### **Sample Input**

5 5
123
1 4 2
1 2 3 1 4 2 2 5 6 3 4 1
3 4 1
11
12
2 3
2 5

# **Sample Output**

```
1
3
5
5
10
```

# **Explanation**

```
\begin{array}{l} Q_1\colon \{3,4\} \\ Q_2\colon \{1,3\}, \{3,4\}, \{1,4\} \\ Q_3\colon \{1,4\}, \{1,2\}, \{2,4\}, \{1,3\}, \{2,3\} \\ Q_4\colon \{1,4\}, \{1,2\}, \{2,4\}, \{1,3\}, \{2,3\} \\ \dots \text{etc.} \end{array}
```
